Ground base part A

Ground base part B

Spiked end to go through the ground base and into the ground

Screw end, thread end

Screw end, hollow end

F

Water bowl, mesh bowl and frame

G

Hooks

H

Hooks with butterfly top

Instructions

Advice

If you want to build upwards, the ground base will stand freely on an even floor or can go in the ground ahead of building the rest. Otherwise leaving the ground base to one side, build laying the structure flat on the ground, only lifting when you are ready to place it in your garden (recommended).

NB If you want to use a patio base you will not require the ground base.

To build:

1. Slot ground base part B into ground base part A, do not tighten the screw. If placing in the ground to build upwards do so now.
2. Slot part C into the ground base and tighten the ground base screw to secure. If you have already placed the ground base into the ground ensure that pole C goes into the ground at the same or similar depth to the ground base forks. The spiked end should help the pole go into the ground.
3. Screw part D into part C
4. Screw part E into part D, you should now have one long pole
5. Slide part F (the metal frame for the water bowl and mesh tray) over the top of the pole and fix where you wish using the screw. We recommend at least 1.2m from the ground to enable birds to evade cats. Once fixed place the water bowl and mesh tray in the frame.
6. Ensuring the screws are fully unwound but not loose, leaving no obstruction on parts G and H.
7. Slide part G over the top, followed by part H. When part H is on as far as it will go, slide part G up to meet it and screw both in place. You should have a 4-way set of hook arms (North, East, South and West).
